# Chapter 1

## Class Index

### 1.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

<a href="#">BlinkDB</a>	A simple in-memory key-value store with basic persistence . . . . .	<a href="#">3</a>
<a href="#">BlinkServer</a>	Implements a TCP server that handles multiple client connections using kqueue . . . . .	<a href="#">5</a>
<a href="#">ClientState</a>	Maintains the read and write buffers for a connected client . . . . .	<a href="#">6</a>

## Chapter 2

# Class Documentation

### 2.1 BlinkDB Class Reference

A simple in-memory key-value store with basic persistence.

#### Public Member Functions

- `BlinkDB ()`  
*Constructor that clears any existing AOF file.*
- `~BlinkDB ()`  
*Destructor that removes the AOF file upon shutdown.*
- `void set (const string &key, const string &value)`  
*Stores a key-value pair in the database.*
- `string get (const string &key)`  
*Retrieves the value associated with a key.*
- `void del (const string &key)`  
*Deletes a key-value pair from the database.*

#### 2.1.1 Detailed Description

A simple in-memory key-value store with basic persistence.

`BlinkDB` provides thread-safe operations for setting, getting, and deleting keys. It writes all operations to an append-only file (AOF) for durability.

#### 2.1.2 Constructor & Destructor Documentation

##### 2.1.2.1 BlinkDB()

```
BlinkDB::BlinkDB () [inline]
```

Constructor that clears any existing AOF file.

Removes the AOF file at startup to simulate a fresh database instance.

## 2.1.3 Member Function Documentation

### 2.1.3.1 del()

```
void BlinkDB::del (  
    const string & key) [inline]
```

Deletes a key-value pair from the database.

**Parameters**

<i>key</i>	The key to delete.
------------	--------------------

If the key exists in the in-memory store, it is removed and the deletion command ("DEL") is appended to the AOF file for persistence.

**2.1.3.2 get()**

```
string BlinkDB::get (  
    const string & key) [inline]
```

Retrieves the value associated with a key.

**Parameters**

<i>key</i>	The key to retrieve.
------------	----------------------

**Returns**

The value associated with the key, or an empty string if the key is not found.

This function is thread-safe and looks up the value in the in-memory store.

**2.1.3.3 set()**

```
void BlinkDB::set (  
    const string & key,  
    const string & value) [inline]
```

Stores a key-value pair in the database.

**Parameters**

<i>key</i>	The key to store.
<i>value</i>	The value associated with the key.

This operation is thread-safe. It updates the in-memory store and appends the corresponding "SET" command to the AOF file for persistence.

The documentation for this class was generated from the following file:

- main.cpp

## 2.2 BlinkServer Class Reference

Implements a TCP server that handles multiple client connections using kqueue.

## Public Member Functions

- **BlinkServer ()**  
*Default constructor initializes server file descriptor and kqueue descriptor.*
- void **run ()**  
*Starts the server.*

### 2.2.1 Detailed Description

Implements a TCP server that handles multiple client connections using kqueue.

[BlinkServer](#) listens on a specified port and accepts incoming client connections. It processes commands encoded in the Redis RESP-2 protocol (SET, GET, DEL) by interacting with an internal [BlinkDB](#) instance. The server uses kqueue for asynchronous event handling.

### 2.2.2 Member Function Documentation

#### 2.2.2.1 run()

```
void BlinkServer::run () [inline]
```

Starts the server.

This function sets up the server socket, initializes kqueue, and enters the main event loop.

The documentation for this class was generated from the following file:

- main.cpp

## 2.3 ClientState Struct Reference

Maintains the read and write buffers for a connected client.

### Public Attributes

- int **fd**  
*File descriptor for the client's socket.*
- string **read\_buffer**  
*Buffer to store data read from the client.*
- string **write\_buffer**  
*Buffer to store data to be written to the client.*

### 2.3.1 Detailed Description

Maintains the read and write buffers for a connected client.

This structure stores the state for a client connection including the socket file descriptor, a buffer for incoming data (read\_buffer), and a buffer for outgoing data (write\_buffer).

The documentation for this struct was generated from the following file:

- main.cpp
